

Giraud Mirco

Rome, Italy | (+39) 333-1051518 | mrcgiraud@gmail.com | [LinkedIn](#)

Software developer with 3 years of experience in backend development for financial applications. Proficient in C#, JavaScript, C++, and Python. Passionate about designing scalable and efficient systems for high-volume, data-intensive trading and risk management platforms.

EMPLOYMENT EXPERIENCE

Quant Developer at Iccrea Banking S.p.A. (Rome, headquarters)

April 2022 – Today

(4th Italian Banking Group by Total Asset €180B – Net Asset €12B)

1 year contract [4/2022 – 4/2023] + Permanent Contract [4/2023 - Ongoing]

- Designed and implemented pricing libraries for exotic and illiquid instruments using Mark-to-Model techniques, streamlining the bank's periodic asset valuation.
- Built and deployed cross-departmental data ingestion pipelines and communication protocols to integrate Front Office, Middle Office, and Trading operations.
- Led multi-platform distribution of pricing and aggregation tools, improving computational efficiency and turnaround.
- Developed ETL (extract, transform, load) solutions to consolidate portfolio data from all assets managed by the parent company and the 105 cooperative banks of the group, with fully automated daily updates.

Key Projects

[Portfolio Market Risk Monitor Suite (Project 2022 - Ongoing)]

- Designed and developed the official interest rate risk monitoring tool for the Group Finance and Front Office division, used daily to oversee risk exposure across Banking, HTC, HTCS, and derivatives portfolios (> €12B total exposure).
- Enables real-time analytics on risk sensitivities, Mark-to-Market values, and PnL metrics with interactive charting, anomaly detection, ISIN/TradeID-level detail, and automated historical tracking.
- The suite delivers high-frequency reporting with minimal latency and is deployed across all trading floor terminals (45 workstations), with over 250 hours of monthly usage.
- Structured into two core modules — Risk Sensitivities and Derivatives — it integrates deeply into the risk workflow, becoming a key infrastructure component for financial decision-making and the official risk monitoring tool for Front Office

[PMRM – Linux service (Project 2024)]

- Developed a high-performance, multi-threaded Linux daemon for large-scale risk sensitivities computation across 203 portfolios belonging to 105 banks and ~40,000 risk factors, achieving ~119k rows processed in 13 seconds.
- Outputs are formatted and published automatically to a centralised group-wide portal, providing daily Mark-to-Market risk exposure for integration with strategic decision-making tools and regulatory dashboards.

[Iccrea FineMese (Project 2022)]

- The programme acquires data from various Excel spreadsheets and databases to automatically create reports and custom files that are securely transmitted via Sterling IBM. It produces e-mails with body, attachments and signatures via Interop Office libraries.

[Iccrea Spread Curve (Project 2022 - Ongoing)]

- Engineered an automated service to construct institutional yield curves derived from Italian government benchmarks, in compliance with Group financial policy.
- The service, deployed on a server, runs daily and outputs a Word report enabling scenario-based curve shifts for BCCs, and a PDF document tracking historical spreads for the Head of Group Finance.
- Generates mktimp files for direct integration into Summit 6.3 (Finastra) to support interest rate model calibration and pricing routines.

[Initial Margin Rebate (Project 2025 - Ongoing)]

- Developed a service for the Middle Office to calculate monthly initial margin requirements for cleared derivative positions across 105 cooperative banks (BCCs), integrating Mark-to-Market values and CSA collateral terms.
- The system ingests trade and collateral data, matches cleared hedging derivatives with underlying positions, and outputs a standardized report with risk-adjusted margin exposures for internal and regulatory use.

[Bloomberg Automation (Project 2022 - 2023)]

- Created a solution leveraging Bloomberg APIs and automated input simulation on Bloomberg Launchpad to price Asset-Backed Securities (ABS) issued by Iccrea (3 tranches per ABS).
- Reduced overall valuation time by 85% (from 2 hours to 16 minutes) and ensured consistency in model inputs and outputs.

Internship 3+6 months

- Contracted with HRC to improve upon the initial prototype of GSS (Safety and Health Manager) with new functionalities. The software aims to be a HSE manager for big industries (chemicals and machinery) such as Fincantieri, Henkel, Epta to help them record and collect data regarding each employee's task, activity and connect them to their department or specific area.
- Designed and built HTML pages to input health reports, machinery, personal safety devices, and related CRUD (Create, Read, Update, Delete) operations on SQL database. Made extensive use of IIS, Bootstrap 5, DevExtreme, DevExpress, Serilog, MVC models.
- Designed a 3D model of a mechanical joint between a Leica's camera and a robotic arm (UR3), using Blender.
- Maintained relationships with external consultants for the development of software solutions that meet their needs. Redacted reports and management of orders / projects for evaluation of work progress.

ADDITIONAL INFORMATION

- **Skills:** C#, C++, HTML, SQL, Python (fundamentals), PostgreSQL, MAUI, API, ASP NET MVC.
- **Applications:** VisualStudio, Bloomberg, Summit Finastra, MathLab, Microsoft Office, Adobe Suite, Ableton, Blender, Cad3D.
- **Additional Courses:** Comau Use and Programming (score Advanced)
- **Languages:** Fluent in Italian, English (IELTS Level C1 in 2019 + First Cambridge English 166 in 2016), basic Romanian and French.
- **Interests:** Finance, cooking, volleyball (division C1), fitness, motocross, painting, guitar, hiking.

EDUCATION

Liceo Scientifico Carlo Cattaneo (High School), Turin	2012-2017
• Diploma in Applied Sciences. • Ranked 1st in logical-mathematical contest GioiaMathesis National Olympiad Ranking. • Achieved Comau Use and Programming (score Advanced). • Developed Winform Application in C# and Console application in C++.	
Polytechnic of Turin (Mechanical Engineering), Turin	2017-2019
• English taught course. • Related exams: Mathematical Analysis I, Computer Science, English.	
WallStreet English School	2019
• Advanced English course.	
University of Turin (Economics and Statistics for Enterprises), Turin	2019-2023
• Related exams: Technical Analysis and Financial Markets, Financial Markets, Microeconomics.	
NFL (Naples Fintech Laboratory), Naples	2024
• Financial Innovation lab, focused on developing AI solutions for banking sector. • Design and developed fraud detection and tailored communication tools based on GenAI.
